- Verbella SAP Export Connector for Kofax
- Verbella HR Document Control Center
- Verbella Document Migration Toolset
- Verbella Sales Order Tracking Center

Verbella SAP and Ariba Document Imaging

Overview

Verbella CMG provides SAP and Ariba Document Imaging Solutions that maximize your existing technology investment. Our experienced consultants utilize their decades of experience to deliver turnkey Solutions that are designed to streamline your SAP business processes.

Document Imaging Options

Late Archiving with Barcode- The least expensive and lowest ROI option, which takes place after transactional documents have been processed. The barcode table in SAP is used to link the scanned document image to the SAP business object, allowing SAP users to view these documents in SAP.

Early Archiving with Key to Entry- The next step towards a paperless environment. Documents are captured as Paper, email attachments, EDI, pdf's, or any other format and linked to the transaction in SAP or Ariba. The image is automatically stored in a content repository and linked to the transaction, and the metadata is manually entered into SAP. This allows all processing to be done more efficiently with the documents available as digital images.

Early Archiving with OCR- This is the a very efficient way to capture and process your SAP and Ariba transactional documents. Documents are captured and Optical Character Recognition (OCR) is used to find the required metadata. Once the metadata has been validated, it populates SAP or Ariba and the image is linked to the transaction and stored in a content repository.

AP Automation with OCR- This is the most efficient way to capture and process your Vendor Invoice Invoices. OCR data directly sent an AP Automation solution such as the Verbella Invoice Tracking Center (ITC), OpenText's Vendor Invoice Management (VIM) or into Ariba. Invoices are automatically Posted, Parked, then routed to users for Coding and Approvals and exceptions are quickly identified so that they can worked on. Images are stored on an ArchiveLink repository and linked to the accounting document as well as the workflow item.
